

System Overview

What is SkillFlow?

SkillFlow is an enterprise skill management platform that enables employees to document skills, request training, and participate in projects based on their competencies.

Core User Roles

Employee

- Requests skill additions (existing skills)
- Proposes new skills (not in system) - available company-wide when approved
- Proposes new training programs (not in system) - available company-wide when approved
- Enrolls in training programs
- Gets assigned to projects
- Primary identifier: employee_id

Manager

- Approves/rejects skill addition requests
- Approves/rejects training enrollment requests
- Reviews employee justifications
- Must provide rejection reasons in notes field

Project Manager (PM)

- Creates and manages projects
- Assigns employees to projects (manual or AI-assisted)
- Has capacity limits based on risk_load

Company Admin

- Approves new skill requests (system-wide additions)
- Approves new training requests (system-wide additions)
- Reviews items not handled by direct managers

- Final authority on expanding system capabilities
-

Critical Field Definitions

description Field

- **Always written by:** Employee
- **Purpose:** Justification, proof, or reasoning for the request
- **Used in:** Skill requests, training requests, project context
- **Examples:**
 - "Used React extensively in Q3 marketing dashboard project"
 - "GitHub portfolio: github.com/user/project - 2 years experience"
 - "Completed this in previous role at CompanyX (2020-2023)"

notes Field

- **Always used for:** Rejection reasons ONLY
 - **Written by:** Manager or Admin (whoever rejects)
 - **Required when:** Request is denied
 - **Examples:**
 - "Insufficient evidence provided"
 - "Skill not demonstrated at required proficiency level"
 - "Training not aligned with current business needs"
-

Workflow 1: Add Existing Skill

Question Patterns This Answers

- "How do I add a skill I already have?"
- "I have experience with [skill], how do I add it?"
- "How do I prove I know [skill]?"

When to Use This Workflow

- Skill **already exists** in SkillFlow system
- Employee gained skill through:
 - Previous employment
 - Completed project work
 - External training/certification
 - Personal projects (e.g., GitHub, portfolio)

How to File This Request

Employee must provide:

- skill_id - Select the existing skill from system
- employee_id - Your employee ID
- description - **Provide your justification/proof**

Description should include:

- Where you used this skill
- Projects or work examples
- Links to portfolios/repositories
- Duration of experience
- Certifications (if applicable)

Process Flow

1. **Employee files request** with evidence in description
2. **Manager reviews** the justification
3. **Manager decides:**
 - **Approve** → Skill added to employee profile + email notification sent
 - **Reject** → Manager must fill notes with reason

Success Outcome

- Skill appears on employee profile
- Employee receives email confirmation

- Skill can be used for project matching
-

Workflow 2: Request New Skill (Not in System)

Question Patterns This Answers

- "The skill I need doesn't exist in the system"
- "How do I suggest a new skill?"
- "Who approves new skills?"
- "Can I add a skill that doesn't exist yet?"

When to Use This Workflow

- Skill **does not exist** in SkillFlow database
- Employee needs a skill that should be available company-wide
- You want to propose a skill for all employees to use

How to File This Request

Employee must provide:

- name - Clear, industry-standard skill name (e.g., "React.js", "Azure DevOps", "Kubernetes")
- description - What the skill is and where it's used in the industry
- employee_id - Your employee ID

Description should include:

- Industry-standard definition of the skill
- Where this skill is commonly used
- Why it's relevant to the company
- Related technologies or use cases

Process Flow

1. **Employee files new skill request**
2. **Skips direct manager** - goes directly to Company Admin

3. **Company Admin reviews:**

- **Approve** → Skill created and available system-wide to all employees
- **Reject** → Rejection stored internally

Key Differences

- **Not reviewed by direct manager**
 - Requires **Company Admin approval**
 - Creates **system-wide capability** when approved
 - **All employees** can then request this skill using Workflow 1
-

Workflow 3: Create Project

Question Patterns This Answers

- "How do I create a new project?"
- "What information is needed for a project?"
- "How does project risk affect managers?"

Who Can Use

Project Managers only

How to File This Request

Project Manager must provide:

- `company_id` - Company identifier
- `description` - Project details and scope
- `start_date` - Project start date
- `end_date` - Project completion date
- `risk` - Risk level (Low/Medium/High/Critical)

Project Risk Levels

Risk Level Impact		PM Capacity Rule
Low	Minimal complexity	PM can handle up to 4 projects simultaneously
Medium	Moderate workload	Moderate capacity consumption
High	Significant complexity	Limited parallel projects allowed
Critical	Maximum complexity	Only 1 project allowed at a time

Risk Load System

- Each PM has a risk_load value
- Risk level of project reduces available capacity
- System prevents overallocation based on risk

Employee Assignment Options

1. **Manual selection** - PM chooses employees directly
2. **AI-assisted matching** - Chatbot recommends best-fit employees based on:
 - Required skills
 - Employee skill profiles
 - Current availability
 - Past project performance

Workflow 4: Project Manager Registration

Purpose

Registers a new Project Manager within a company

How to Register

Must provide:

- company_id - Company identifier
- username - Unique username
- full_name - PM's full name

- gender - M (Male) or F (Female)
- age - Must be ≥ 20 years old
- email - Valid email address
- password - Secure password
- risk_load - Initial capacity for managing projects

Validation Rules

- Age minimum: 20 years
 - Gender must be M or F
 - Email must be valid format
 - Username must be unique within company
-

Workflow 5: Enroll in Existing Training

Question Patterns This Answers

- "How do I sign up for training?"
- "I want to take [training], what's the process?"
- "Who approves training requests?"

When to Use This Workflow

- Training program **already exists** in system
- Employee wants to develop new skills

How to File This Request

Employee must provide:

- training_id - Select the existing training from system
- employee_id - Your employee ID
- description - **Explain why you need this training**

Description should include:

- Business justification

- How it relates to current/future projects
- Career development goals
- Expected impact on your work

Process Flow

1. **Employee files enrollment request** with justification
2. **Manager reviews** business case
3. **Manager decides:**
 - **Approve** → Employee can start training session
 - **Reject** → Manager must fill notes with reason (e.g., "Not aligned with current role", "Budget constraints")

Success Outcome

- Employee gains access to training
 - Can proceed to Workflow 6 (Start Training Session)
-

Workflow 6: Start Training Session

Question Patterns This Answers

- "How do I start my approved training?"
- "What happens after training is complete?"
- "When do I get the skill from training?"

Requirements

- Training enrollment request must be **already approved** (see Workflow 5)

How to Start Session

Employee must provide:

- request_id - ID of the approved training enrollment request
- employee_id - Your employee ID
- start_date - When you'll start the training

- end_date - Expected completion date

Process Flow

1. Employee starts approved training session
2. Training progresses from start_date to end_date
3. **Upon successful completion:**
 - Associated skill **automatically added** to employee profile
 - No additional approval needed
 - Employee notified of skill acquisition

Automatic Skill Grant Rule

Training completion = Automatic skill addition

- No manager approval needed post-training
 - Skill immediately available for project matching
 - Appears on employee profile
-

Workflow 7: Request New Training (Not in System)

Question Patterns This Answers

- "The training I need doesn't exist"
- "How do I suggest a new training program?"
- "Who approves new training requests?"
- "Can I propose a training that's not available?"

When to Use This Workflow

- Training program **does not exist** in SkillFlow
- Employee identifies training gap
- You want to propose a training program for company-wide use

How to File This Request

Employee must provide:

- name - Training program name
- notes - **What the training covers and why it's needed**
- employee_id - Your employee ID
- skill_id - The skill this training should grant upon completion

Notes field should include:

- Training curriculum or topics covered
- Business case for this training
- Why it's valuable for the company
- How it fills a current skill gap
- Expected outcomes

Process Flow

1. **Employee files new training request**
2. **Goes to Company Admin** (not direct manager)
3. **Company Admin reviews:**
 - **Approve** → Training created and available system-wide
 - **Reject** → rejectNote is **mandatory**

Key Differences

- Creates **new training program** (not just enrollment)
- Requires **Company Admin approval**
- Becomes available to **all employees** when approved
- **All employees** can then enroll using Workflow 5

Important: One Request Per Task

Each task requires a separate request to be filed

Examples:

- Want to add 3 skills? → File 3 separate requests

- Need to enroll in 2 trainings? → File 2 separate requests
- Proposing multiple new skills? → File one request per skill

Why?

- Each request is reviewed independently
- Different reviewers may handle different requests
- Clearer tracking and approval history
- Better audit trail

Summary of Request Routing

Request Type	Filed By	Reviewed By	Scope When Approved
Add Existing Skill	Employee	Manager	Individual employee
New Skill	Employee	Company Admin	Company-wide
Enroll Existing Training	Employee	Manager	Individual employee
New Training	Employee	Company Admin	Company-wide
Create Project	Project Manager	N/A (direct creation)	Company

Common User Questions - Quick Reference

"Why was my request rejected?"

- Check the notes field in your request
- Manager/Admin must provide reason in notes when rejecting
- Common reasons: insufficient evidence, not aligned with business needs, budget constraints

"How long does approval take?"

- Depends on reviewer availability
- Manager reviews: typically faster (direct reports)

- Admin reviews: may take longer (company-wide impact)

"Can I request multiple items at once?"

- **No** - file one request per task
- Each skill, training, or item needs its own request
- This ensures proper tracking and individual review

"What's the difference between 'description' and 'notes'?"

- **description:** Employee writes (justification, proof, reasoning)
- **notes:** Manager/Admin writes (rejection reasons only)

"Who sees company-wide requests?"

- New skill requests → Company Admin
- New training requests → Company Admin
- These create resources available to all employees

"Do I need manager approval for new skill/training requests?"

- **No** - these go directly to Company Admin
- Manager only reviews personal skill additions and training enrollments

"What happens after training completion?"

- Skill is **automatically added** to your profile
- No additional approval needed
- You'll receive a notification

"How does AI help with projects?"

- PM can use AI to match employees to projects
- AI considers: skills, availability, past performance
- Final decision remains with PM
- AI can create learning plans for employees.

Skill Acquisition Paths

Employees can gain skills through three routes:

1. Request Existing Skill (Workflow 1)

- Prove you already have it
- Manager approval required

2. Complete Training (Workflows 5 & 6)

- Enroll in training
- Complete successfully
- Skill automatically granted

3. Project Assignment

- Work on projects requiring specific skills
 - Gain experience
 - Later request skill addition with project as evidence
-
